

THE FRONTIERSMAN

Issue #12, April 1, 2021

A California city has replaced every human janitor with robots to save costs – could your job be next?

Working- and middle-class American families face automation threats from more Silicon Valley labor elitism

The robot uprising has begun.

Last week, embattled Google CEO and known liberal sympathizer Sundar Pichai has announced a rollout of retail bots aimed at replacing cashiers and strengthening the Democratic establishment’s chokehold on our economy.

Amazon’s newest HomeDev product is aligned to break the unspoken family tradition of folding laundry, violating the sanctity of the American household. And despite recent high-profile fatal accidents involving outspoken anti-automation conservative officials, Uncle Sam has approved the integration of Argo AI technology into all federal government transportation vehicles. Were the crashes targeted? Official investigations claim no, but we all see the violence inherent to the system.

When will this stop? When can the left finally decide it has taken enough from American livelihoods? The conceptual tradition of the hard-working American man is under attack from all sides – he cannot even provide for his family without his employers or backstabbing politicians disregarding his need to put food on the table.

Not only is it harmful to human livelihoods, it’s also disrespectful to tradition and to human skill to replace the hard work done by human hand with the cold, grotesque, mechanical repetition that a machine provides. Every dollar placed in a cash register by human fingers has a story, has a purpose behind it. Silicon Valley’s robots share none of those – these technological prophets are only programmed to profit.

The odds are stacked against the American people. In a world where citizens are led on by superficial dreams of a labor-less society and corporations only care about their bottom line, not even President Trump can stop liberal shortsightedness from corrupting our society. The responsibility now falls on us – the people. If we don’t speak up soon, then after the robots replace our jobs and our families, we won’t have the money or influence to speak up at all.

BREAKING: Amazon wants robots to reduce GOP votes

Written by Ned Ludd

In a series of leaks exposing internal emails within the executive board of Amazon, disgraced CEO Jeff Bezos made comments describing Republican voters as “barbaric” and expressing his desire to “convert

them all” to the recent liberal fervor that has swung through the tech industry.

Bezos was also caught making jokes about “those poor workers” that his products were replacing.

On their own, these comments don’t seem like much – Bezos is just another tech executive who is out of touch with middle America. However, consider his labor policies – before he automated away human workers entirely, Bezos created computer business systems that made labor so mindless it would deprave employees of their humanity. Now, his robots are pushing those same workers out of the economy. Why?

It comes down to nasty politics. Bezos has realized that the hardworking American man knows his values and supports the GOP, so to get the policies he wants passed, Amazon is attempting to break your spirit and your bank account. Amazon wants you replaced with robots so you can’t vote against them.

We cannot afford to lose this fight. We the working class are all that stands between the glory of yesterday and the technocratic dystopia of tomorrow.

Wake up, America. Don’t trust the system. The robot revolution is coming, and it’s coming for you.

Is Obama American?

Your greatest fears about 44, FINALLY confirmed. A new AI algorithm EXPOSES the TRUTH about his birth.

The Supreme Court has ruled 7-2 in *United States v. Microsoft* in a groundbreaking decision to finally break up the tech giant. Microsoft has announced it will be splitting into two companies: Micro, specializing in its hardware devices, and Soft, spinning off its software products.

A Brave New Nation of Lazy Liberals

Written by Simon A.J. Head

We see it all the time on our TVs, our YouTube videos. “Automation is the future,” the ads blare. “Humans are lovers, not laborers.”

Despite the terrible slogan, the

idea of replacing human laborers with machines. Of course, this goal is not realistic or pragmatic – how could we ever support ourselves if no one worked? However, I argue there is a stronger factor than

Without labor, how shall we ever find life to be fulfilling?

left continues winning support for their latest bad idea: the automation movement. Buoyed by an immature desire to never work for the rest of their lives, a vocal minority now supports the

reality that we must consider: fulfillment.

Think about it. As much as you hate the 9 to 5 – and trust me, I despise work as much as the

next person – the regular schedule gives you a reason to wake up every day. You look forward to driving home, kissing your wife, and hugging your kids simply because you can’t do it all the time. Scarcity increases value – it’s basic economics. What the left is proposing will absolutely destroy what human society has gradually balanced over the millennia.

Furthermore, working demands time and effort from humans – our jobs are very much a labor of love. Through this exertion, we build up a sense of dignity for ourselves and each other. By taking away our work, we not only destroy our own productivity, but we also challenge the foundations of human dignity that our sense of fulfillment relies so heavily upon.

The liberals, blinded by the cardinal sin of sloth, desire a futuristic society so consumerist that we lose our purpose in life, driven only by a superficial pursuit for pleasure and entertainment. They can take their legal drugs and sex ed with them – we’ll continue with our perpetual perseverance and human grit that makes America great.

Machines will never replace humans – they're too error-prone

AI Cracks Killing Fields Mystery

For 50 years, the Texas Killing Fields remained one of the FBI’s most haunting unsolved murder cases. But the mystery was no match for modern technology.

By Ada Hopper

Since the 1970s, the bodies of young women, gone missing days before, have turned up in a small, rural field in between Houston and Galveston in southeast Texas. Presumed to be the handiwork over several serial killers over the decades, not even the best efforts from local police departments could solve the mysteries and bring the murderers to justice.

That was, however, until artificial intelligence got involved. PostCrime, a Texas-based startup that specializes in analyzing crime scenes, was quietly given a license to the Killing Fields last March. In a groundbreaking discovery, Post Crime released the names last week of all 25 serial killers they determined

were responsible for the deaths of over fifty innocent girls, leading to the arrest by authorities of the 15 that were still alive to face punishment.

Though most of their methods are proprietary, PostCrime made public their usage of thorough drone scanning to construct every bit and particle of the Killing Fields in a digital simulation, as well as access to government records on every citizen in the nearby League City area, in order to identify the criminals.

“Honestly, I don’t even need to do my job anymore,” stated League City police chief David Buffkin. “This AI tech stuff has got it all covered.”

MCDONALD’S WORKER STRIKE CONTINUES

A recent decision by the fast food giant to remove its human staff still faces stiff opposition

Written by Olivia Xu

Remember the fond childhood memory of sitting in the backseat, eagerly awaiting your Happy Meal? You giggled in the back as the drive-thru worker handed a bag to your mom and

pop, smiled, and wished you a nice day. No more – the good old days are over. The industry behemoth decided it prized profits over people in a landmark decision
